**What is Saridon and what is it taken for?**
Saridon is an analgesic medication. It relieves pain and reduces fever. It is used to treat headache, toothache, period pain, rheumatic pains, pain following surgery and the pains and fever which accompany colds and “flu”.

**When must Saridon not be taken?**
You must not take Saridon if you are allergic to propyphenazone, other pyralozone compounds, or paracetamol (acetaminophen). You must not take Saridon if you have a serious liver or kidney condition or inherited anemia (congenital hemolytic anemia). Saridon must not be given to children under 12 years of age.

**When should you be especially careful while taking Saridon?**
Do not take doses of Saridon higher than those set out in this package leaflet. As with all analgesics, you should not take Saridon regularly over a long period except under medical supervision.

You should keep in mind that if you continually take analgesics to treat headaches the headaches may become chronic.

If you take large amounts of Saridon or any other analgesic containing paracetamol (acetaminophen) over a long period you may suffer kidney damage or even kidney failure.

If you have fever or pain lasting more than one week you should see your doctor.

If you suffer from asthma, chronic colds or chronic hives, or if you are hypersensitive to other analgesic or antirheumatic medications you should take Saridon only after consulting your doctor. Respiratory problems and circulatory system reactions have been reported in persons taking medicines containing paracetamol (acetaminophen) or propyphenazone, particularly in susceptible individuals.

Do not take analgesics such as Saridon together with alcohol, or if you suffer from an alcohol-related disorder.

Tell your doctor or pharmacist (chemist) if you have other illnesses or allergies, or if you are taking other medicines (including those not prescribed by a doctor).

**May Saridon be taken during pregnancy or breast-feeding?**
If you are pregnant or breast-feeding a child does not take Saridon unless you have your doctor's express permission.

**How should Saridon be taken?**
The single dose for adults is 1-2 tablets; for adolescents aged 12-16 years it is 1 tablet. If necessary, you may take up to single doses within 24 hours.

Take the tablets with ample water or other fluid. Keep to the dosage specified by your doctor. If you think the effect of the medicine is too weak or too strong, talk to your doctor or pharmacist (chemist).

**What are the possible unwanted effects of Saridon?**
Occasionally, allergic reactions (skin rash, hives) have occurred in people who are taking Saridon. Respiratory problems or circulatory system reactions may occur, particularly in susceptible individuals (see Precautions, above).

If you notice any such effects, do not take any more Saridon and see a doctor as soon as possible.

**General remarks?**
Keep this medicine out of the reach of children. Do not use after the expiry date (EXP) shown on the pack.

You can get further information from your doctor or pharmacist (chemist), who have detailed information.

**What does Saridon Contain?**
Each tablet contains 250 mg paracetamol, 150 mg propyphenazone and 50 mg caffeine as its active ingredients.

**Where can you obtain Saridon? What packs are available?**
At pharmacies, without a doctor’s prescription. Packs of 10 tablets.
