is achieved only after a few weeks of treatment. Treatment with Pulmicort is prophylactic therapy with no demonstrated effect on acute disorders. In patients in whom an increased therapeutic effect is desired, in general an increase of the Pulmicort dose is to be recommended in preference to combination treatment with oral corticosteroids because of the lower risk of systemic side effects.

Patients dependent on oral steroids:
When transfer from oral steroids is initiated the patient must be in a relatively stable condition. A high dose of Pulmicort is given in combination with the previously used oral steroid dose for 10 days. After that, the oral dose should be gradually reduced by e.g. 2.5 mg prednisolone or equivalent per month to the lowest possible level. The oral steroid can often be discontinued entirely.

Since budesonide given as Pulmicort suspension for nebuliser is deposited in the lungs with the aid of inspiration, it is important that the patient inhales calmly and with even breaths through the mouth-piece of the nebuliser.

There is no experience of treatment of patients with impaired hepatic or renal function. Since budesonide is eliminated predominantly through metabolism in the liver, increased exposure may be expected in patients with severe cirrhosis of the liver.

Instructions for correct use of Pulmicort Nebuliser
Pulmicort suspension for nebuliser should be administered via a jet nebuliser equipped with a mouth-piece or suitable facemask. The nebuliser should be connected to an air compressor with an adequate airflow (5-8 l/min), and the fill volume should be 2-4 ml.

Note It is important to instruct the patient
• to carefully read the instructions for use: “How to use Pulmicort Nebuliser”
• that Ultrasonic nebulisers are not suitable for the administration of Pulmicort Nebuliser Suspension and therefore are not recommended.
• Pulmicort Nebuliser Suspension can be mixed with 0.9% saline and with solutions for nebuliser of terbutaline, salbutamol, sodium cromoglycate and ipratropium
• to rinse the mouth out with water after inhaling the prescribed dose to minimise the risk of oropharyngeal thrush
• to wash the facial skin with water after using the face mask to prevent irritation
• to adequately clean and maintain the nebuliser according to the manufacturer’s instructions
A facemask can be used for children who cannot breathe in through the mouthpiece.

Contraindications
Hypersensitivity to budesonide or any of the other ingredients.

Special warnings and special precautions for use
In order to minimise the risk of Candida infections in the oral cavity and throat, the patient should be instructed to rinse the mouth with water after each dose administration.
Concomitant treatment with ketoconazole, itraconazole or other potent CYP3A4 inhibitors should be avoided. If this is not possible, the interval between administrations of the medications should be as long as possible.
Particular care is needed in patients transferring from oral steroids, since they may remain at risk of impaired adrenal function for a considerable time. Patients who have required high dose emergency corticosteroid therapy or prolonged treatment at the highest recommended dose of inhaled corticosteroids, may also be at risk. These patients may exhibit signs and symptoms of adrenal insufficiency when exposed to severe stress. Additional systemic corticosteroid cover should be considered during periods of stress or elective surgery.
Caution must be observed in treatment of patients who are transferred from systemically acting corticosteroids to Pulmicort and in cases of suspected disturbance of pituitary-adrenocortical function. In these patients there should be a cautious reduction of the dose of systemic steroid, and tests of hypothalamic-pituitary-adrenocortical function should be considered. They may also require the adjunct of systemic steroids in connection with periods of stress, e.g. surgery, trauma, etc.
During transfer from oral steroid therapy to Pulmicort, patients may experience previous symptoms such as muscle and joint pain. In these cases a temporary increase of the oral steroid dose may be necessary. If, in isolated cases, fatique, headache, nausea, vomiting or similar symptoms occur, a generally unsatisfactory effect of the steroid should be suspected.
Replacement of systemic steroid treatment by Pulmicort sometimes reveals allergies, e.g. rhinitis and eczema, that were previously controlled by the systemic treatment.
Regular monitoring of growth is recommended in children and adolescents receiving long-term treatment with corticosteroids, irrespective of the administration form. The benefits of corticosteroid treatment must be placed in relation to possible risks of inhibition of growth.
Patients must be instructed to contact their physician if the effect of the treatment generally diminishes, as repeated inhalations for severe asthma attacks must not delay the initiation of other important therapy. If there is a sudden deterioration the treatment must be supplemented with a short course of oral steroids.

Interactions
No clinically relevant interactions with asthma agents are known.
Ketoconazole 200mg once daily increased the plasma concentrations of oral budesonide (3mg in a single dose) on average six-fold when administered concomitantly. When ketoconazole was administered 12 hours after budesonide, the concentration was increased on average three-fold. Information about this interaction is lacking for inhaled budesonide, but markedly increased plasma levels are also expected in such cases. The combination should be avoided since data to support dose recommendations are lacking. If this is not possible, the time interval between administration of ketoconazole and budesonide should be as long as possible. A reduction of the budesonide dose must also be considered. Other potent inhibitors of CYP3A4, i.e. itraconazole also cause a marked increase in the plasma levels of budesonide.
Pharmacodynamic properties

Budesonide is a glucocorticosteroid with a high local anti-inflammatory effect.

The precise mechanism of action of glucocorticosteroids in the treatment of asthma is not fully understood. Anti-inflammatory effects such as inhibited release of inflammatory mediators and inhibition of cytokine-mediated immune response are probably important. The activity of budesonide, measured as affinity for glucocorticosteroid receptors is approx. 15 times higher than that of prednisolone.

Budesonide has anti-inflammatory effects shown as reduced bronchial obstruction during both the early and the late phase of an allergic reaction. In hyper-reactive patients budesonide reduces the histamine and metacholine reactivity in the airways.

Studies have shown that the earlier budesonide treatment is initiated after the onset of asthma, the better lung function can be expected.

Studies in healthy volunteers with Pulmicort Turbuhaler have shown dose-related effects on plasma and urinary cortisol. At recommended doses, Pulmicort Turbuhaler, causes significantly less effect on the adrenal function than prednisone 10 mg, as shown by ACTH tests.

In children over the age of 3 years, no systemic effects have been detected with doses up to 400 micrograms per day. In the range 400-800 micrograms per day biochemical signs of a systemic effect may occur. With daily doses in excess of 800 micrograms such signs are common. This information applies to Pulmicort administered as inhalation spray and inhalation powder.

Asthma itself, like inhaled corticosteroids, can delay growth. However, studies in children and adolescents who were treated with budesonide for a long period (up to 11 years) show that the patients reach expected adult height.

Inhalation therapy with budesonide is effective in preventing exercise-induced asthma.

Pharmacokinetic properties

Absorption

Inhaled budesonide is rapidly absorbed. The peak plasma concentration is reached within 30 minutes after the start of nebulisation.
### Distribution and metabolism
Plasma protein binding is approx. 90%. The volume of distribution is approx. 3 l/kg. Budesonide undergoes extensive (approx. 90%) first pass metabolism in the liver to metabolites with low glucocorticosteroid activity. The glucocorticosteroid activity of the major metabolites, 6ß-hydroxy-budesonide and 16alpha-hydroxy-prednisolone, is less than 1% of that of budesonide.

### Elimination
Budesonide is eliminated through metabolism, catalysed primarily by the enzyme CYP3A4. The metabolites are excreted in the urine in unchanged or conjugated form. Only negligible amounts of unchanged budesonide are recovered in the urine. Budesonide has a high systemic clearance (approx. 1.2 l/min), and the plasma half-life after intravenous administration is on average 4 hours. The pharmacokinetics of budesonide is proportional to the dose at relevant dosages.

The pharmacokinetics of budesonide in children and in patients with impaired renal function is unknown. Exposure to budesonide may be increased in patients with hepatic disease.

### List of excipients
- Disodium edetate
- Sodium chloride
- Polysorbate 80
- Anhydrous citric acid
- Sodium citrate
- Purified water

### Incompatibilities
Pulmicort nebuliser suspension can be mixed with sodium chloride solution 9 mg/ml (0.9%) and/or with nebuliser solutions containing terbutaline, salbutamol, fenoterol, acetylcysteine, sodium cromoglycate or ipratropium bromide. The admixture should be used within 30 minutes.

### Shelf-life
Please refer to expiry date on outer carton. Single-dose units that are stored in an opened envelope must be used within 3 months. The contents of an opened single-dose unit must be used within 12 hours.

### Special precautions for storage
Do not store above 30°C. Do not freeze. Always keep unopened single-dose units in the foil envelope in order to protect from light.

### Pack size
Please refer to outer carton for pack size.

### Date of revision of the text
January 2005

### How to use Pulmicort Nebuliser
1. Before use, re-suspend the contents of the single dose unit by using a gently swirling motion.
2. Hold the single dose unit upright (see picture) and open by twisting off the wing.
3. Place the open end of the unit well into the reservoir of the nebuliser, and squeeze slowly. The single dose unit is marked with a line (Pulmicort 0.25 mg/ml and 0.5 mg/ml only). This line indicates the 1 ml volume when the single dose unit is held up-side down.

If only 1 ml is to be used, empty the contents until the level of the liquid reaches the indicator line. Store the opened single dose unit protected from light. Opened single dose units must be used within 12 hours.

Before using the rest of the liquid, re-suspend the contents of the single dose unit by using a gently swirling motion.

### Note:
1. Rinse your mouth out with water after each dosing occasion.
2. If you use a facemask, make sure that the mask fits tightly while you are inhaling. Wash your face after treatment.

### Cleaning
The nebuliser chamber and the mouthpiece, or the facemask, should be cleaned after each use. Wash the parts in hot tap water using a mild detergent or according to the instructions supplied by the manufacturer of the nebuliser. Rinse well and dry by connecting the nebuliser chamber to the compressor or air inlet.
